Polynomial evaluation

$$p(x) = 9x^{4} + 3x^{3} - 2x^{2} + 5x + 7$$

 $p(2) = ?$

Method 1: (Halverson)

Metho 2:

$$2.2 = (2)^{2}$$
 $2.(2) = 2^{3}$
 $2.2 = 2^{4}$
 $2.1 = 2^{4}$
 $2.2 = 2^{4}$
 $2.2 = 2^{4}$
 $2.2 = 2^{4}$
 $2.2 = 2^{4}$
 $2.2 = 2^{4}$
 $2.2 = 2^{4}$

Meta 7: Horner's method (nested polynomial evaluation)

$$P(x) = 7 + 5x - 2x^{2} + 3x^{3} + 9x^{4}$$

$$= 7 + x \left[5 - 2x + 3x^{2} + 9x^{3} \right]$$

$$= 7 + x \cdot \left[5 + x \cdot \left[-2 + 3x + 9x^{2} \right] \right]$$

$$= 7 + x \cdot \left[5 + x \cdot \left[-2 + x \cdot \left[3 + 9 \cdot x^{2} \right] \right] \right]$$

$$= 4 + x \cdot \left[5 + x \cdot \left[-2 + x \cdot \left[3 + 9 \cdot x^{2} \right] \right] \right]$$

$$= 4 + x \cdot \left[5 + x \cdot \left[-2 + x \cdot \left[3 + 9 \cdot x^{2} \right] \right] \right]$$

$$= 4 + x \cdot \left[5 + x \cdot \left[-2 + x \cdot \left[3 + 9 \cdot x^{2} \right] \right] \right]$$

$$= 4 + x \cdot \left[5 + x \cdot \left[-2 + x \cdot \left[3 + 9 \cdot x^{2} \right] \right] \right]$$

$$= 4 + x \cdot \left[5 + x \cdot \left[-2 + x \cdot \left[3 + 9 \cdot x^{2} \right] \right] \right]$$

$$= 4 + x \cdot \left[5 + x \cdot \left[-2 + x \cdot \left[3 + 9 \cdot x^{2} \right] \right] \right]$$

$$= 4 + x \cdot \left[5 + x \cdot \left[-2 + x \cdot \left[3 + 9 \cdot x^{2} \right] \right] \right]$$

$$= 4 + x \cdot \left[5 + x \cdot \left[-2 + x \cdot \left[3 + 9 \cdot x^{2} \right] \right] \right]$$

$$= 4 + x \cdot \left[5 + x \cdot \left[-2 + x \cdot \left[3 + 9 \cdot x^{2} \right] \right] \right]$$

$$= 4 + x \cdot \left[5 + x \cdot \left[-2 + x \cdot \left[3 + 9 \cdot x^{2} \right] \right] \right]$$

$$= 4 + x \cdot \left[5 + x \cdot \left[-2 + x \cdot \left[3 + 9 \cdot x^{2} \right] \right] \right]$$

$$= 4 + x \cdot \left[5 + x \cdot \left[-2 + x \cdot \left[3 + 9 \cdot x^{2} \right] \right] \right]$$

$$= 4 + x \cdot \left[5 + x \cdot \left[-2 + x \cdot \left[3 + 9 \cdot x^{2} \right] \right] \right]$$

It operations is a proxy for complexity of an alsor. Ihm
